ABSTRACT

This report discusses simulators in automata theory and which one should be best for use in laboratory assignments. Currently, the Formal Languages, Automata and Theory of Computation course (FABER) at Mälardalen University uses the JFLAP simulator for extra exercises.

To see if any other simulators would be useful either along with JFLAP or standalone, tests were made with nine programs that are able to graphically simulate automata and formal languages. This thesis work started by making an overview of simulators currently available. After the reviews it has become clear to the author that JFLAP is the best choice for majority of cases. JFLAP is also the most popular simulator in automata theory courses worldwide.

To support the use of JFLAP for the course a manual and course assignments are created to help the student to getting started with JFLAP. The assignments are expected to replace the current material in the FABER course and to help the uninitiated user to get more out of JFLAP.

SUMMARY

JFLAP is the currently used simulator in the Formal languages, Automata and Theory of Computation course (FABER) at Mälardalen University. The tests are made with nine programs including JFLAP to see which one that met all our requirements. Every simulator was tested with a set of test cases and discussions were made about if the tested automata simulator met given requirements. The manual and assignments are created for JFLAP which is found to be the best simulator to be used in the FABER course at MDH.
